

United Nations International Strategy for Disaster Reduction

The Grand Challenges of Integrated Research on Disaster Risk

Presentation to IUGG General Assembly Melbourne, June 2011

IRDR Integrated Research on Disaster Risk

Professor Gordon McBean Institute for Catastrophic Loss Reduction The University of Western Ontario, Canada Chair, Science Committee Integrated Research on Disaster Risk President – START International

Number of "natural" catastrophes

Number of natural catastrophes 1980-2010

MUNICH RE Topics Geo 2010

Overall losses and insured losses - Absolute values and long-term trends

HAZARD: potentially damaging phys or human activity that MAY cause the **The Grand Challenge:** How can science (all sciences) help reduce the number and impacts of disasters?

"serious disruption of the" functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources."

Disasters result when there is the intersection of a hazard and exposed vulnerability

Research -

•Hazards

10

la

- •Exposure
- •Vulnerability
- •Response
- •Coping
- •Intersections

International Context

- World Commission on Environment and Development
- sustainable development in the statement: "Humanity has the ability to make development sustainable - to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs".

- future generations - "seeing the future"

- integrated, multi-disciplinary, sciencebased predictions of the future are essential.
- Disasters exert a powerful influence over economic and social development and can diminish and even reverse the economic development of states.

World Summit on Sustainable Development -Millennium Development Goals

- *IV. Protecting and managing the natural resource base of economic and social development*
- 37. An integrated, multi-hazard, inclusive approach to address vulnerability, risk assessment and disaster management, including prevention, mitigation, preparedness, response and recovery, is an essential element of a safer world in the twenty-first century. Actions are required at all levels to:

World Conference on Disaster Reduction, Kobe, January 2005 Hyogo Framework for Action (HFA) Priorities for Action

- 1. Ensure that disaster risk reduction is a national and a local priority with a strong institutional basis for implementation.
- 2. Identify, assess and monitor disaster risks and enhance early warning.
- **3.** Use knowledge, innovation and education to build a culture of safety and resilience at all levels.
- 4. Reduce the underlying risk factors.
- 5. Strengthen disaster preparedness for effective response at all levels.

ICSU Priority Area Assessment on Capacity Building in Science (2005): Executive Summary

- Great challenge is 'a development problem...the widening gap between advancing science and technology and society's ability to capture and use them.'
- The increases in costs of disasters are taking place in both developed and developing countries, which suggest that reducing the risks from hazards is not simply a matter of economic growth and development.
- There is a great shortfall in current research on how science is used to shape social and political decision-making in the context of hazards and disasters.

ICSU Scoping & Planning Groups

- The Scoping Group: Why, despite advances in the natural and social science of hazards and disasters, do losses continue to increase?
- Planning Group Assessment: Despite all the existing or already planned activities on natural hazards, an integrated research programme on disaster risk reduction, sustained for a decade or more and integrated across the hazards, disciplines and geographical regions, is an imperative. The valueadded nature of such a programme would rest with the close coupling of the natural, socioeconomic, health and engineering sciences.

Integrated Research on Disaster Risk

Addressing the challenge of natural and human-induced environmental hazards (IRDR) An integrated approach to research on disaster risk through: an international, multidisciplinary (natural, health, engineering and social sciences, including socio-economic analysis) collaborative research programme. - Sept/2008

A Science Plan for Integrated Research on Disaster Risk Addressing the challenge of natural and human-induced environmental hazards

Objective 1:

Characterization of hazards, vulnerability and risk

- 1.1: identifying hazards and vulnerabilities leading to risks;
- 1.2: forecasting hazards and assessing risks; and
- 1.3: dynamic modelling of risk.

Objective 2:

- 2.1: Identifying relevant decision-making systems and their interactions
- 2.2: Understanding decision making in the context of environmental hazards; and
- 2.3: Improving the quality of decision-making practice.

Reducing risk and curbing losses through knowledge-based actions
- 3.1: Vulnerability assessments;
- 3.2: Effective approaches to risk reduction

Cross-Cutting Themes

- **1. Capacity building**
- 2. Case studies and demonstration projects
- 3. Assessment, data management and monitoring

IPCC Special Report on Climate Extremes

100

and Pacific – Kuala Lumpur

Global Change System for Analysis, Research and Training: START

The objective of START's research-driven capacity building activities is to engage the scientific communities of developing regions in collaborative scientific research on GEC, applications and action/policy.

Forensic Disaster Investigations (FORIN)

- Probe further into complex and underlying causes of growing disaster loss
- Fundamental cause of disasters
- Trace out and assign causal explanation of losses
- Intervening conditions that increased or reduce losses
- Series of case studies
- Common template and methodology

Risk Interpretation and Action (RIA)

- How actors attempt to make sense of experience and information from various sources as a basis for decision.
- Estimation of the likelihood, magnitude of event & vulnerability of physical infrastructure
- Social and behavioural factors leading to greater or lesser risk

03-200	Bangla 1970 – 3	adesh – Bola 300,000 deaths	atalities

Bangladesh Cyclone Preparedness Programme

FORIN What contributed to reductions??

2011 Global Assessment Report on Disaster Risk Reduction: Revealing Risk, Redefining Development

- 2.2.1 Weather-related mortality risk remains highly concentrated in countries with low GDP and weak governance
- 2.2.5 Countries that are falling behind in their development achievements have less resilience to disaster loss

Percentage change in flood mortality risk, exposure and vulnerability. as modelled. from 1980–2010

East Asia and the Pacific

2.2.4 Tropical cyclone and flood economic loss risk is increasing

Mega Disaster in a Resilient Society The Great East Japan (Tohoku Kanto) Earthquake and Tsunami of 11th March 2011

Assessment of Integrated Research on Disaster Risk (AIRDR)

Purpose: to undertake the first systematic and critical global assessment of published research on disaster risk under the auspices of the IRDR—new knowledge

Approach:

- 1. Documentation and critical assessment of extant literature on disaster risk
- 2. Identification of what is known well and empirically supported, what is less well known, and what gaps exist in our research knowledge base, and what opportunities exist for new research in the co-production of knowledge
- 3. integrated research assessment report similar to the "Disasters by Design" concept and similar in style to the IPCC.

AIRDR Goals

- Provide a baseline of the current state-of-thescience in integrated research on disaster risk to measure effectiveness of multiple research programs
- Use to identify and support longer-term science agenda for the research community and funding entities
- Provide scientific evidentiary basis in support of policy and practice

Disaster Loss Data WG

- Can we improve the existing data quality?
- Can we make the data landscape more transparent?
- Can we strengthen the data platform efforts?
- Collaborate with IUGG Commission on Data and Information, CoDATA and World Data Centers.

Registration and Abstract Submission Open

IRDR Conference 2011 Oct. 31 - Nov. 2, Beijing www.irdrinternational.org/conference2011

Why, despite advances in the natural and social science of hazards and disasters, do losses continue to increase?

To what extent is the world-wide growth in disaster losses a symptom and indicator of unsustainable development?

Unsustainable development?

IRDR Legacy

• An enhanced capacity around the world to address hazards and make informed decisions on actions to reduce their impacts.

• Societies to shift focus from responserecovery towards preventionmitigation, building resilience and reducing risks, learning from experience and avoiding past mistakes.
