Reduction

# Safety Assessment of flood defences in the Netherlands

An ongoing concern

**Don de Bake MSc. & Ard Wolters MSc.**  
***Ministry of Transport, Public Works and Water  
Management***  
***Centre for Water Management***

Rijkswaterstaat

# Outline

## **Dutch water management**

- o Some facts
- o History
- o Present approach to flood control (Flood Defense Act)

## **Assessment of primary flood defences**

- o How does assessment work?
- o Results 2<sup>nd</sup> national report, 2006
- o Evaluation
- o Towards the 3<sup>rd</sup> report, 2011

# Some facts about the Netherlands

Area below MSL, or threatened by rivers

- 41.528 km<sup>2</sup>
- 26% below **mean** sea level (NAP)
- 66% of the area is flood prone
- 9 million people live in these low areas
- 70% of GNP is earned in flood-vulnerable area

# Examples of floodings in The Netherlands, the coast

## The Northsea

- ▶ 1570, nov. 1<sup>st</sup> All-Saints-Flood.  
> 20.000 died. Lots of towns drowned.
- ▶ 1916, jan. 13/14<sup>th</sup>. Flooding around Zuiderzee, now Lake IJssel.  
Start of Zuiderzee Works, e.g. Afsluitdijk
- ▶ 1953, disaster in Southwest Holland.  
> 1800 people died.  
Start of Deltaworks

# Zuiderzee works: Afsluitdijk (1932)

# Deltaworks: Storm Surge Barrier Eastern Scheldt (1986)

# Deltaworks: Storm Surge Barrier Maeslant (1997)

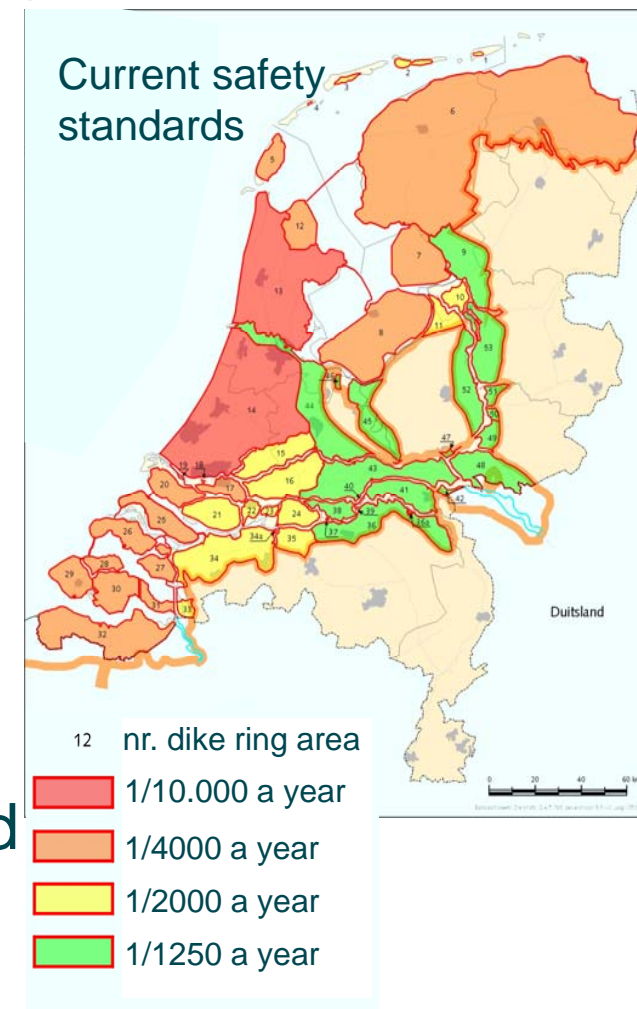

# Present approach to Flood Protection

## 1960 advise Delta Committee

- Close estuaries, shorten the coastline 700 km.
- A safety standard (norm) based on a CBA was proposed

## 1996 Flood Defences Act

- Objective: durably maintain the achieved safety level
- Based on approach Delta Committee
- 53 'dike ring areas' with safety standard probability of exceedence
- 5 yearly assessment

# Roles Ministry in Flood Protection

## **Roles Directorate General Water, policymaking**

- ▶ Prepare legislation, safety standards
- ▶ Responsible for guidelines (VTV) and hydraulic boundary conditions (HR) for safety assessment
- ▶ Financing the reinforcement of water defences, the Flood Protection Programme

## **Roles Directorate General Rijkswaterstaat, implementation**

- ▶ Implement guidelines and boundary conditions for safety-assessment
- ▶ Manager and maintenance of coastline, rivers and 10% of the defences (mainly dams)

## **Role Transport and Water Management Inspectorate, Inspection**

- ▶ Evaluate safety assessment and management

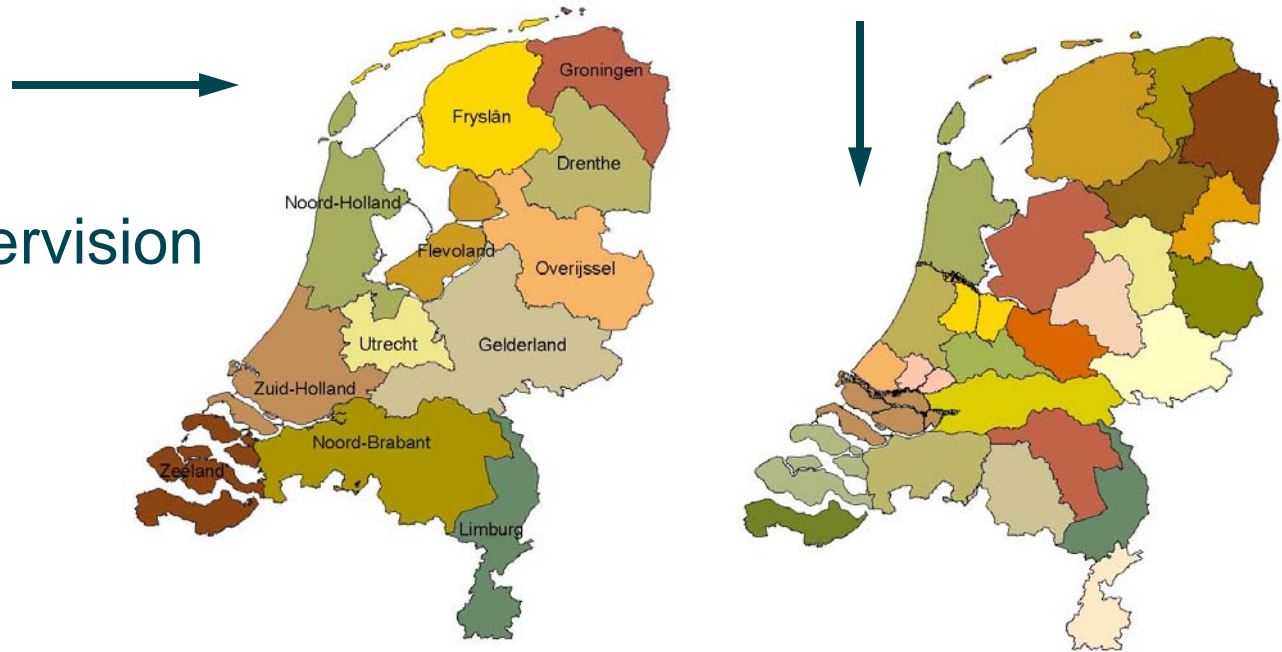

# Other organisations in Flood Protection

## 26 Water Boards (manage 90% of defences)

- ▶ Daily management and maintenance
- ▶ Carry out safety assessment and reinforcement works

## 11 Provinces

- ▶ Regional supervision

# Assessment of primary flood defences

Those managing the *primary flood defences* test every five years whether the dikes, dunes and hydraulic structures (e.g. sluices, orifices) meet the statutory safety requirements.

## Primary defences:

- 53 + 42 'dike rings'
- 27 connecting defences (b)
- 3,500 km dikes, dams and dunes
- Appr. 800 structures

Category a  
Direct protection  
(sea, river, lake)

Category b  
Connecting dams

Category c  
Indirect protection

# Statutory safety requirements, the rules

**Article 9 of the FDA states that assessment has to be carried out based on:**

- ▶ Legal safety standard per dike ring (e.g. 1/10.000)
- ▶ Pre-determined Hydraulic conditions (water levels & wave parameters per km)
- ▶ Asset management system ('legger')

Guidelines (calculation rules)

- ▶ Procedures and rules in Directive
- ## Safety Assessment Regulations

# Defence types & Failure mechanisms

## Dikes & dams

- Overflowing/topping (height)
- Stability
- Revetments
- 'strange' objects (cables/pipes)

## Dunes

- Erosion of sand profile
- 'strange' objects

## Structures

- Overtopping
- Strength / Stability
- Operational failure

## 2<sup>nd</sup> assessment of primary flood defences (2006)

- During the assessment the managing authorities check whether the **strength** of the flood defences meets the statutory **requirements** (e.g. loads)
- They report to the provinces. The provincial assessments are submitted to the minister.
- The Inspectorate assesses nationwide. Eventually the minister reports the national overview to the parliament.

# Results 2<sup>nd</sup> safety assessment

2875 kilometres dams, dikes and dunes of category a or b

Dikes and dunes in categories a and b

Figure 1. Assessment of primary water defences 2006 – categories a and b (total 2875 km).

# Comparison 1<sup>st</sup> and 2<sup>nd</sup> assessment

## Category a & b defences

- ▶ 1264 km, or **44%** meets the standard.  
1<sup>st</sup> assessment in 2001: **40%**.

- ▶ 680 km, or **24%** does not meet the standard.  
1<sup>st</sup> assessment in 2001: **19%**.

- stresses the urgency of already initiated works (revetments Zeeland, Lake IJssel)

- more failure modes investigated, not only height

- ▶ 931 km, or **32%** was labelled 'no judgement'.  
1<sup>st</sup> assessment in 2001: **41%**.

- the inability to gather sufficient data

- insufficiency of the set of instruments available. (HC, Guidelines)

Figure 1. Assessment of primary water defences 2006 – categories a and b (total 2875 km).

# Special Situations

## ► Coastal Weak Links

Wave loads appeared higher in 2003. The programme CWL was started.

## ► Category C defences

No Hydraulic Boundary Conditions were available.

## ► The Maeslant storm surge barrier

Design criterium '*probability of failure per closure*  $< 1:1000$  not met.  
Hinterlandstudy carried out in 2007. Conclusion: barrier does not meet the standard.

## ► Afsluitdijk (enclosure dam)

Not high enough, cannot withstand erosion. Hinterland study.  
Conclusion: dam does not meet the standard

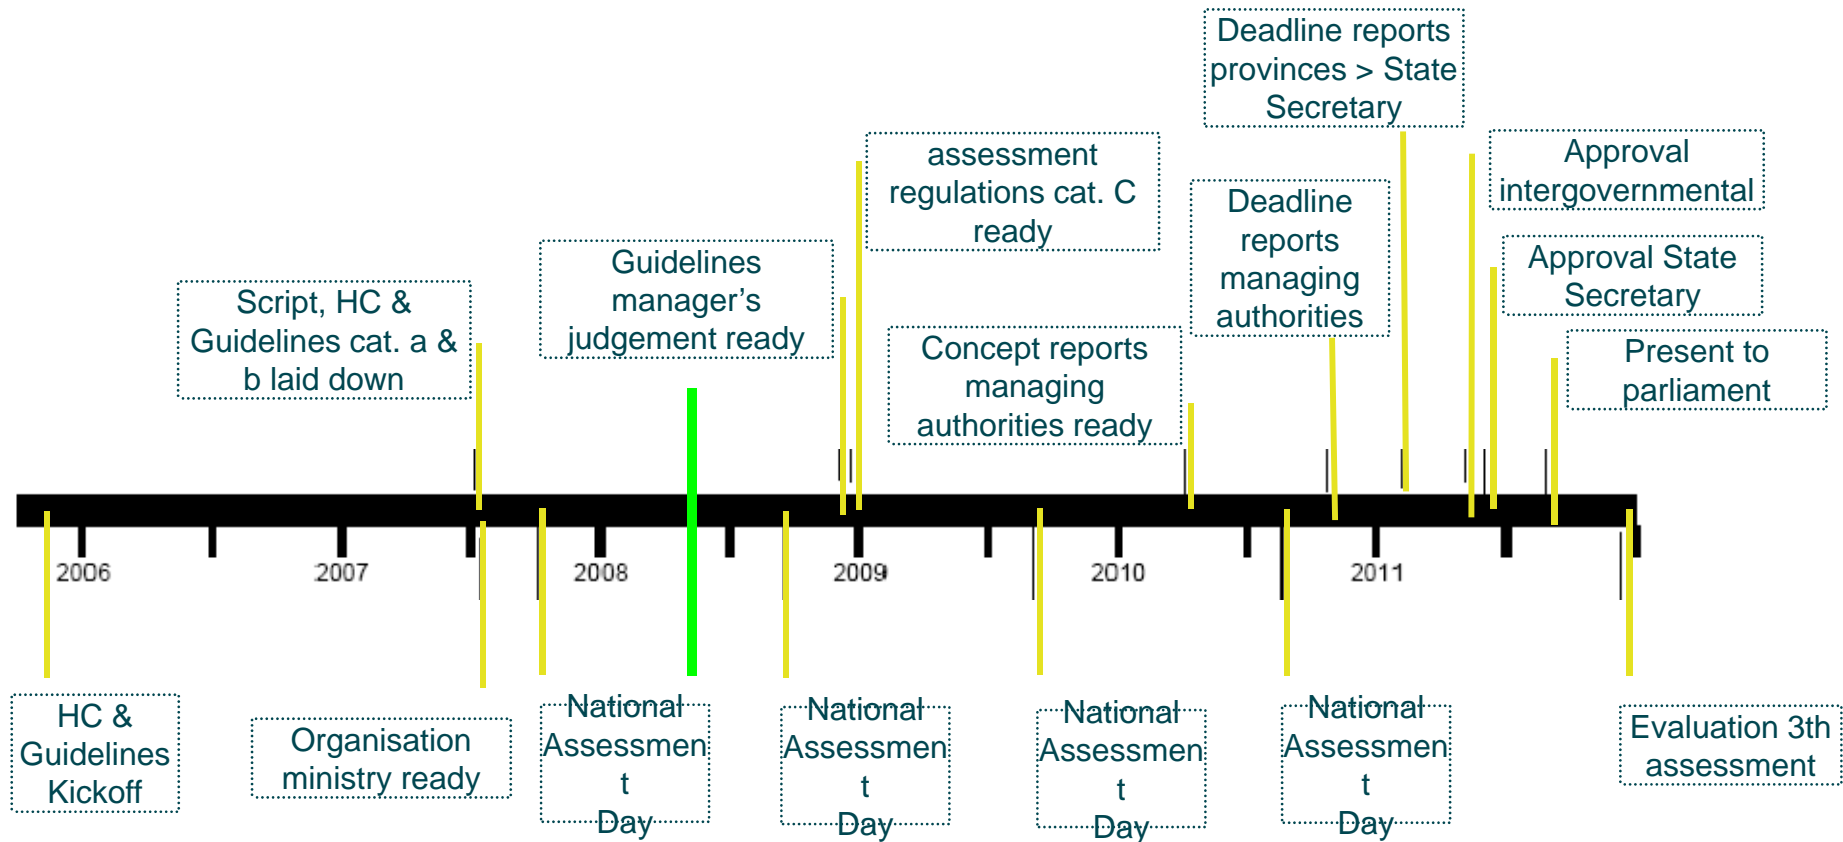

# Consequences of 2<sup>nd</sup> assessment

- Defences that don't meet the standards, need to be improved/strengthened
- Projects are classed under the “Flood Protection Programme”. Finished in **2015** at cost of **2.3 billion Euro**

# Towards 3<sup>rd</sup> assessment, 2011

# Conclusions & recommendations

- ▶ Big achievement for the involved parties, mainly the water boards.
- ▶ 2<sup>nd</sup> assessment more complete than the 1<sup>st</sup>
- ▶ Essential information for the assessment has to be provided on time (*Hydr. Bound. Cond. & Guidelines*)
- ▶ Roles of the involved parties must be very clear, therefore a script for the assessment-proces is needed
- ▶ Gaps in the assessment regulations need to be filled (*category C, Waveloads in Waddensea and at the coast*)

# Questions
